

Nitty Gritty NitFree Comb

Why It Works

Perfect Teeth

Nits are about half a millimetre long, and 0.2 to 0.3 millimetres wide. They are attached to each hair strand with a strong glue, and they are impervious to ordinary combing. But the Nitty Gritty comb's 33 microgrooved steel teeth remove and destroy even the very smallest nits without pulling, cutting or hurting the hair they cling to. No other comb can do this.

Mind The Gap

The teeth are separated from each other by a carefully-calculated gap, which is smaller than even the tiniest nit. And their extra length goes all the way through even the thickest, luxuriant locks, to remove more nits in fewer passes. Long and fine, or short and curly, the Nitty Gritty comb works equally well in any kind of hair.

Groovy!

Every one of the Nitty Gritty comb's 33 teeth carries a spiral "microgroove". Look closely and you'll see they're shaped like tiny drill bits. Why? Because this makes it impossible for nits and eggs caught by the comb to slip out and escape when they're trapped between two grooved steel teeth.

The teeth of a conventional metal or plastic comb will bend around nits, rather than gripping and dragging them off the hair surface.

But look at our comb under a microscope and you'll see the difference. The microgroove on each tooth works to pull a tiny spiral cutting edge through your hair. And the teeth are welded into the comb handle in a special process, which keeps that vital microgroove working all the way through your hair. It is devastatingly effective, breaking the hermetic sealing of the nits, to injure and destroy them without tearing or pulling your hair.

All nits and eggs that come into contact with the NitFree comb's microgrooving as they pass through the comb teeth end up being unviable.

Steel Appeal

The special stainless steel used to manufacture the comb won't rust or tarnish. Each comb retains its tough, stylish appearance even after prolonged immersion in water and exposure to the different chemical products - such as permethrins, decamethrins, vinegar - found in hair treatments. The comb is designed to be boiled for asepsis: ideal when the same comb is to be used for several family members.

Hot Tips

The end of each comb tooth is machined precisely into the shape of a cone. The cones separate the hair gently and direct each hair strand through the blades without snapping or tangling. The tip of the cone is then rounded, so there is no sharp point to prick, scratch or bruise the scalp. Small children and older family members we have asked both say that this is one of their favourite things about the Nitty Gritty comb.

Can You Handle It?

Use the NitFree comb anywhere - even in the bath or shower! It won't rust or tarnish, there are no sharp corners or edges to poke or scratch you, and the comb's non-slip grips make it easy to use even when you're up to your elbows in soapy water. And it's comfy, which encourages users to comb deeper, more thoroughly and more often than they would with an old-style "scratchy" comb.

Unlike all other combs on the market, the Nitty Gritty comb is built to last from top-quality stainless steel, carries a lifetime guarantee, is available on prescription and is the first choice head lice remedy of a growing number of healthcare and childcare professionals.
